

Partnership Ideas

Worship Earth Foundation x EarthOps PeopleMovers Ecosystem

What We Can Do Together
March 2026

1. IT Services & Development

Platform Development Support

EarthOps runs on PHP + Vue.js with a team of only 10 people. Their CTO Avtar Gour and senior developer Deependra Singh are both based in Jaipur. Worship Earth Foundation can supply additional developers at a fraction of US cost to accelerate platform development, fix bugs, improve mobile apps, and build new features.

AI-Powered Features

Worship Earth has deep experience building AI solutions using Claude AI. This expertise can be applied to build powerful features for EarthOps:

- Automated waste classification using image recognition
- Smart buyer-seller matching in the EarthOps marketplace
- AI chatbot for platform support and environmental guidance
- Predictive analytics for environmental KPIs
- Natural language search across procedures and documents
- Automated news curation and summarization for the Newsroom module

Interactive Dashboards

Worship Earth already builds sophisticated interactive dashboards. The same capability can be deployed for EarthOps clients: environmental performance tracking, waste diversion metrics, compliance status, EarthPerks rewards analytics, and real-time operational monitoring.

DevOps, Cloud & Security

AWS/Azure infrastructure management, database optimization, performance tuning, and security audits. EarthOps currently lacks SOC 2 certification, which is critical for enterprise buyers. Worship Earth can support the preparation process for security certifications.

2. Content & Community Management

Platform Content Management

Currently, Aloysius John in Delhi handles community engagement alone across all three platforms (EarthOps, PeopleMovers, Connect America). He needs a team. Worship Earth can provide content managers to handle newsroom updates, marketplace curation, social media management, and community moderation across all platforms.

Environmental Content Creation

Worship Earth has real, on-the-ground environmental experience. This translates into authentic content that EarthOps badly needs:

- Waste segregation standard operating procedures
- Composting procedures and guides
- Urban river cleanup methodologies
- Corporate waste reduction plans
- Community engagement templates
- Event frameworks (like My River My Valentine)

Client Onboarding Support

Setting up new organizations on the EarthOps platform: uploading procedures, configuring modules, providing training. Remote support during US business hours. This can be offered on a per-client basis.

3. Environmental Consulting

River Cleanup Global Template

The Mula-Mutha river cleanup experience (Trash Boom installation at Bhide Bridge, Shipco Transport CSR funding, PMC permissions, volunteer coordination) is a proven, replicable model. This can be packaged as a global template and published on the EarthOps platform as standardized "procedures." Cities and organizations worldwide can license and adapt this model.

Carbon Credit Advisory

Design carbon offset programs for EarthOps clients. Calculate carbon credits generated from river cleanup, tree planting, and waste diversion projects. The voluntary carbon market is growing rapidly, and Worship Earth's on-ground projects can generate verifiable carbon credits.

Remote Environmental Auditing

Conduct remote environmental audits using the EarthOps platform. This includes waste management compliance checks, supply chain sustainability assessments, and ESG data verification for US and global clients.

4. Joint Grant Applications

The Power Combination

EarthOps is a US-registered entity with a technology platform. Worship Earth Foundation is an India-based organization with ground-level environmental execution capability. This combination (US tech + developing country implementation) is exactly what international funders prefer. Together, they can apply for grants that neither could access alone.

Target Funding Sources

- UN Environment Programme (UNEP)
- USAID environmental programs
- World Bank development grants
- Asian Development Bank (ADB)
- Green Climate Fund
- Global Environment Facility (GEF)
- US EPA grants
- USDA Rural Development grants
- DOE clean energy grants
- Private foundations: Kresge, Ford Foundation, etc.

Grant Writing as a Service

Beyond joint applications, Worship Earth can offer grant writing services to EarthOps and its entire client network. Continuously tracking available grants, matching organizations with relevant funding, and preparing professional proposals.

5. ESG & CSR Services

ESG Report Writing

US companies face increasing ESG reporting mandates. Worship Earth can remotely draft annual sustainability and ESG reports for EarthOps clients using GRI, SASB, TCFD, and ISSB frameworks. This is a high-value, recurring service.

CSR Program Design

Design environmental CSR programs for US corporates: community engagement initiatives, employee volunteering programs, environmental stewardship campaigns. All programs managed and tracked on the EarthOps platform.

Supply Chain Sustainability Audits

Using the EarthOps marketplace and directory to conduct supply chain sustainability assessments. Develop supplier environmental scorecards. Remote auditing and reporting tied directly into EarthOps infrastructure.

Stakeholder Communications

Create sustainability newsletters, social media content, press releases, and investor communications. CSR annual report design and environmental storytelling that builds brand value for EarthOps clients.

6. Training & Certification Programs

EarthOps Branded Certifications

Develop certification programs delivered through the EarthOps platform with assessments and digital badges:

- EarthOps Certified Environmental Manager
- EarthOps Green Building Specialist
- EarthOps Community Sustainability Leader
- EarthOps Waste Management Professional

Environmental Compliance Training

Develop and deliver training content on waste management best practices, US EPA environmental compliance, sustainability reporting frameworks (GRI, SASB, ISSB), carbon footprint calculation, and circular economy principles.

Platform Training

Conduct EarthOps/PeopleMovers platform training sessions for new users and administrators. Develop webinar series, video tutorials, and user guides. This reduces churn and improves client engagement.

Corporate Sustainability Workshops

Deliver virtual and hybrid workshops for EarthOps clients on topics like circular economy, zero waste strategy, net zero roadmaps, environmental leadership, and community engagement best practices.

7. Remote Talent Supply

Virtual Team Supply

Supply trained professionals from India to EarthOps and its client network:

- Environmental data analysts
- Sustainability content writers (ESG, CSR, environmental)
- Graphic designers (reports, infographics, presentations)
- Web and mobile developers (PHP, Vue.js, React Native)
- Virtual assistants (admin, research, customer support)
- Grant researchers and writers

Dedicated Remote Teams

Provide dedicated 3-5 member teams for ongoing environmental program management for EarthOps clients. Monthly managed contracts with guaranteed availability and quality standards.

Training & Placement Pipeline

Develop environmental management training programs in India. Train professionals and place them with companies in the EarthOps network globally. Create a talent pipeline specifically for the sustainability sector.

8. India Market Opportunities

Official India Partner

EarthOps already has India team members (Aloysius John in Delhi, Avtar Gour in Jaipur, Prakash Panjekar). Worship Earth Foundation can become the official India partner, selling the platform to Indian municipalities like PMC and PCMC, and to manufacturing companies as a waste management SaaS solution.

Organized Waste Network

India's waste management market is valued at over \$15 billion. Worship Earth can build organized networks of kabadiwale, recyclers, and waste haulers in Pune and across Maharashtra, connecting them through the EarthOps platform to corporate and institutional clients.

CSR Program Management in India

Indian companies must spend 2% of profit on CSR (mandatory under the Companies Act). Worship Earth + EarthOps platform can offer end-to-end CSR program design, execution, and reporting with audit-ready documentation for Indian corporates.

9. Why This Partnership Makes Sense

For EarthOps / Keith Zendler

- Team of only 10 people but global ambition: needs affordable, capable partners
- India-based services increase margins significantly
- Already has India expansion interest and India team members
- Zero external funding: needs partners who can work, not just invest
- Platform needs content, users, and activity to grow

For Worship Earth Foundation

- Access to US market and global environmental network
- Revenue diversification beyond India
- Real environmental expertise (Mula-Mutha) becomes globally monetizable
- AI and tech skills find a direct commercial application
- Joint grant eligibility opens major international funding doors
- First-mover advantage as EarthOps' primary global partner

Key Advantage

Keith Zendler has 35+ years in waste management (Inc. 500 recognition, USPS/GSA contracts) but his platform has minimal traction. Worship Earth has real environmental execution capability and affordable talent. Neither can unlock the full opportunity alone, but together they cover each other's gaps perfectly.

10. Points to Keep in Mind

- EarthOps has very low market traction: only 10+ Google Play downloads, 2 App Store ratings
- No external funding has been raised by any entity in the ecosystem
- No independent media coverage or third-party reviews exist
- Single founder dependency: the entire ecosystem revolves around Keith Zendler
- Connect America brand conflicts with a major US healthcare company of the same name
- EarthOps brand could be confused with EarthOptics, a different agtech company with \$24M+ funding
- Corporate structure between PeopleMovers.com Inc. and PeopleApps Inc. needs clarity
- No enterprise reference customers confirmed for EarthOps specifically
- Platform lacks audit-ready compliance features (no SOC 2, limited regulatory alignment)

Suggested Approach

Start with low-risk pilot projects. Build trust through small wins. Verify user engagement and financial stability before committing to larger engagements. Request a live platform demo and active user metrics before formalizing any agreement.
